

How It Works

A close-up photograph of a brick wall with reddish-brown bricks and grey mortar. The text is overlaid in the center in a white, bold, sans-serif font.

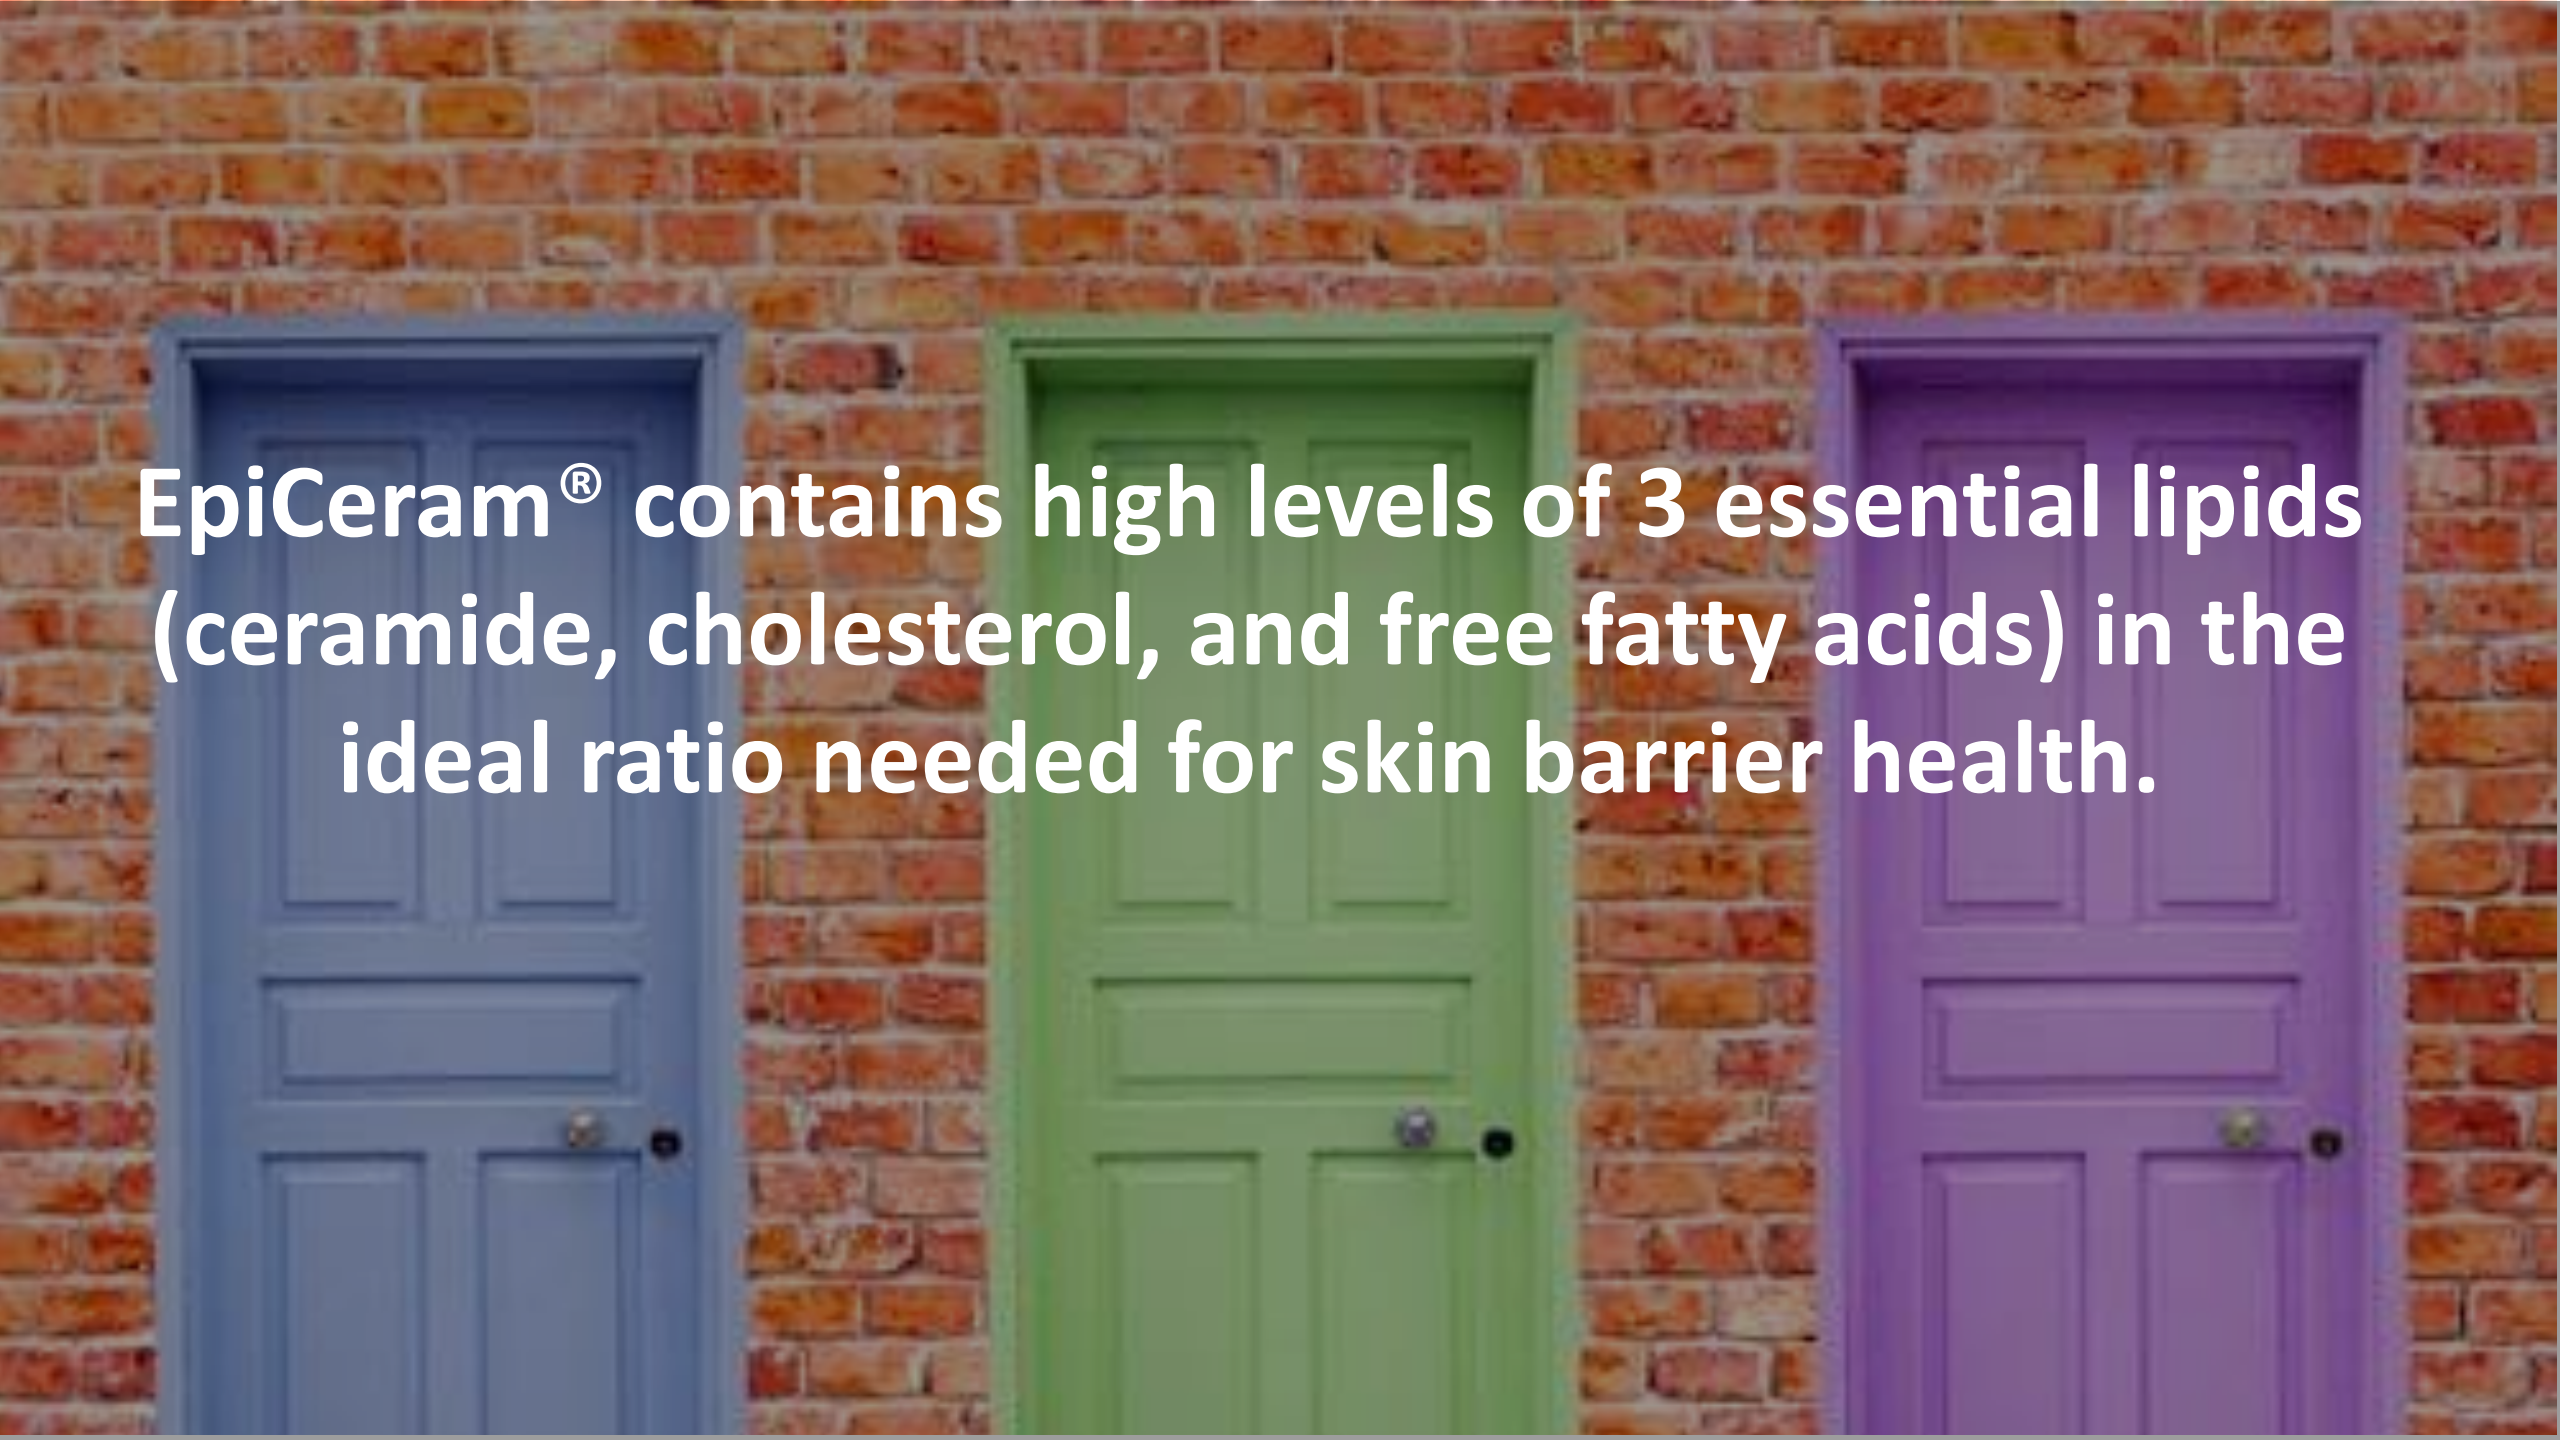

The skin barrier is composed of corneocytes and lipids. Imagine the corneocytes as representing the "bricks of a wall", and the rich lipid matrix the "mortar".

**When the skin barrier breaks down, it
can leave your skin vulnerable.**

Typically moisturizers form a thin barrier to keep the skin's moisture in, but it isn't enough.

The background of the image is a red brick wall. In the foreground, there are three doors of different colors: a blue door on the left, a green door in the center, and a purple door on the right. Each door has a silver handle and a keyhole. The text is overlaid on the image in a white, bold, sans-serif font.

EpiCeram[®] contains high levels of 3 essential lipids (ceramide, cholesterol, and free fatty acids) in the ideal ratio needed for skin barrier health.

EpiCeram restores, repairs and builds a healthy skin barrier, keeping moisture in and irritants out.
